

Lesson 2 Introduction of Warning Light

In this lesson, we will learn how to use RaspTank's warning light function.

2.1 Overview

This tutorial is about how to use multi-threading to achieve some effects related to WS2812 LED lights. Multi-threading is common in robot projects, since robots have high requirements for real-time response. For each task performing, try not to block the main thread communication.

Multi-threading is similar to executing multiple different programs or tasks at the same time. Multi-threaded operation has the following advantages:

1. Using threads to put time-consuming tasks in the background for processing.
2. Improving the efficiency of the program. In the subsequent real-time video and OpenCV processing video frames, multi-threading is used to greatly increase the frame rate.
3. It's more convenient to call an encapsulated multi-threaded task, similar to the non-blocking control method – in other words, the control of the servo is encapsulated by multi-threading.

We use Python's threading library to provide thread-related work, and thread is the smallest unit of work in an application. For the current version of Python, there are no priorities, no thread groups, and threads cannot be stopped, suspended, resumed, or interrupted.

2.2 Running the Warning Light Program

1. Start the RaspTank Robot. It may take about 30-50s to boot.

2. After RaspTank is turned on, open the Chrome browser on your mobile or computer, enter the IP address of your Raspberry Pi and access port ":5000" into the IP address bar, like this:

192.168.3.44:5000. The web controller will then be displayed on the browser.

3. Click "[POLICE LIGHT](#)", and RaspTank will flash lights of different colors.

Note: Currently this module is not compatible with Raspberry Pi 5. You need to wait for the WS1812 official update dependency library to be compatible with Raspberry Pi 5. Some of the latest hardware versions of Raspberry Pi 4 may also have incompatibility issues. This requires waiting for the official update of WS2812.

4. Click "[POLICE LIGHT](#)" again to stop the function.

2.3 Code

For the complete code, please refer to the file [robotLight.py](#).

1. `import time`
2. `import sys`

```

3. from rpi_ws281x import *
4. import threading
5.
6.
7. """
8. Use the Threading module to create threads, inherit directly from threading.Thread, and then o
   verride the __init__ method and the run method
9. """
10. class RobotLight(threading.Thread):
11.     def __init__(self, *args, **kwargs):
12.         """
13.         Here initialize some settings about LED lights
14.         """
15.         self.LED_COUNT      = 16      # Number of LED pixels.
16.         self.LED_PIN        = 12      # GPIO pin connected to the pixels (18 uses PWM!)
17.         self.LED_FREQ_HZ    = 800000  # LED signal frequency in hertz (usually 800khz)
18.         self.LED_DMA         = 10      # DMA channel to use for generating signal (try 1
   0)
19.         self.LED_BRIGHTNESS = 255     # Set to 0 for darkest and 255 for brightest
20.         self.LED_INVERT     = False    # True to invert the signal (when using NPN transistor le
   vel shift)
21.         self.LED_CHANNEL    = 0       # set to '1' for GPIOs 13, 19, 41, 45 or 53
22.
23.         """
24.         Set the brightness of the three RGB color channels, no need to change here, these
   values will be automatically set after the subsequent call of the breathing light function
25.         """
26.         self.colorBreathR = 0
27.         self.colorBreathG = 0
28.         self.colorBreathB = 0

189.     Start the police light mode and stop after 15 seconds
190.     """
191.     RL.police()
192.     time.sleep(15)
193.     RL.pause()
```

2.4 Warning Lights or Breathing Lights in Other Projects

When your project needs to use LED lights for warning lights or breathing lights, you don't need to completely rewrite the code above but just copy *robotLight.py* in the *server* folder in the robot's

package to the same folder of your project, and use the following code to make a warning light or breathing light:

```
1. import robotLight
2.
3. RL=robotLight.RobotLight() # Instantiate the object that controls the LED light
4. RL.start() # Start thread
5.
6. ....
7. Start breathing light mode and stop after 15 seconds
8. ...
9. RL.breath(70,70,255)
10. time.sleep(15)
11. RL.pause()
12.
13. ....
14. Pause for 2 seconds
15. ...
16. time.sleep(2)
17.
18. ....
19. Start the police light mode and stop after 15 seconds
20. ...
21. RL.police()
22. time.sleep(15)
23. RL.pause()
```
